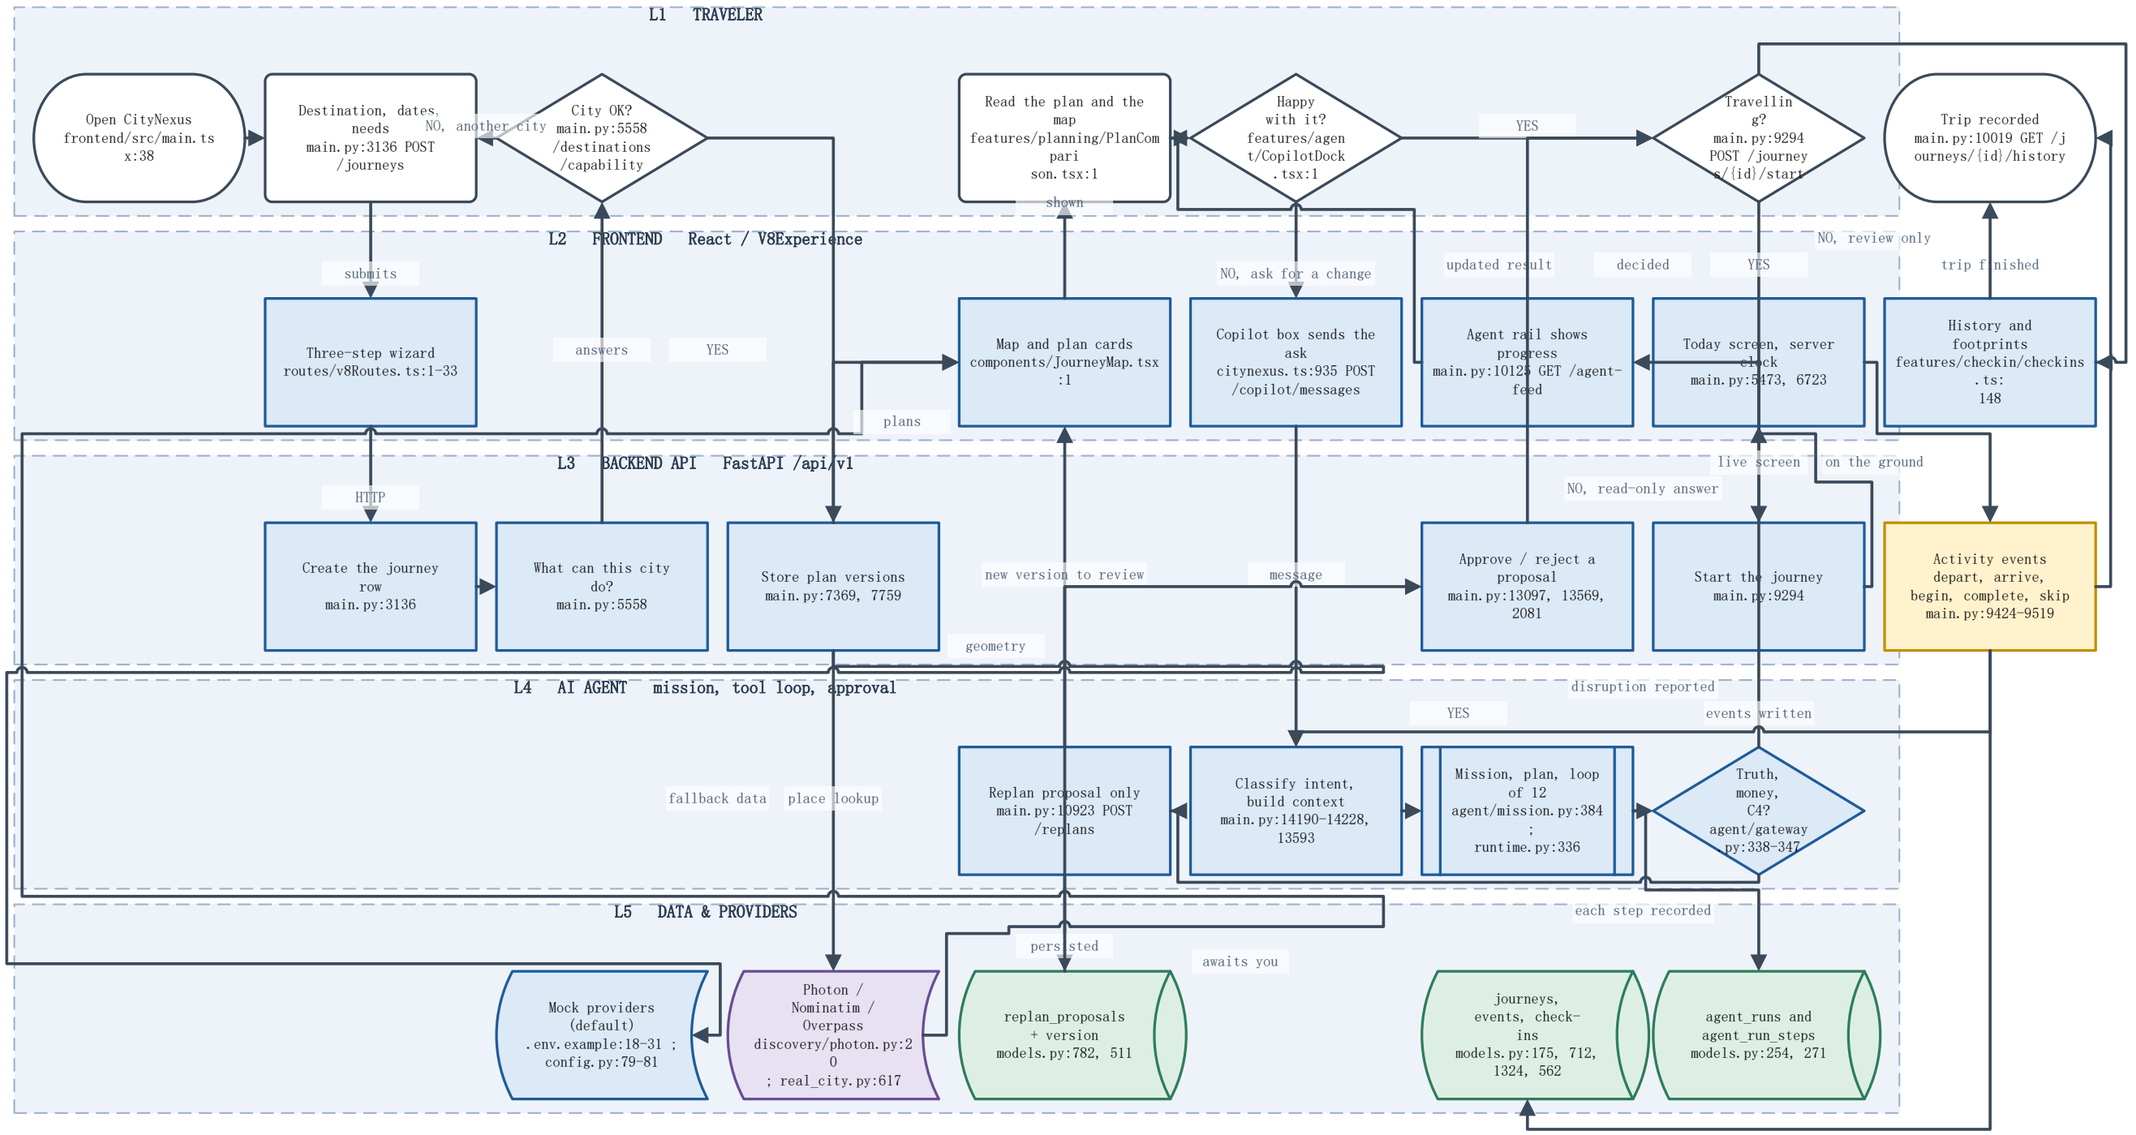
CityNexus | End-to-end User Journey

CNX-SE-VIS-02 User journey (cross-functional flowchart)
Rev A - generated 2026-10-22 - source tree CityNexus @ review/boli-party-occupancy-scope-r1, github.com/Canshu-King/CityNexus

Five swim lanes follow the real call path, from opening the app to the footprint after the trip. The traveler never loses control: an agent may answer a question silently, but anything that changes the plan is written as a proposal and waits for an explicit approval.



HOW TO READ THIS: follow one column at a time. A step in the traveler lane is what you see; the lanes below it are what the product does while you wait.

EVERY BRANCH CLOSES. The two diamonds in the traveler lane and the one in the agent lane each have a labelled YES and NO, and both outcomes lead somewhere; the only terminal shape is the one on the right.

PARTY SIZE AND STAY BUDGET ARE DELIBERATELY LEFT BLANK at first: the journey record keeps three states instead of inventing a value, and a plan that needs a budget you never declared says so (models.py:824 stay_budget_declared; ORD-0355).

ACTIVITY EVENTS (depart, arrive, begin, complete, skip) are wired and reachable, but their real-world timestamps are still recorded as non-blocking debt, which is why that shape is amber (KNOWN_NONBLOCKING_DEBT.md).

The loop back from the agent lane to the map is the point of the product: a change you approve becomes a new plan version, not an edited-over screen.

Legend

- Implemented + evidence (test / published commit)
- Implemented, not yet proven on the line
- Documented intent - no implementation here
- External provider / third-party boundary
- Persistence, audit and operational state
- The traveler's own step
