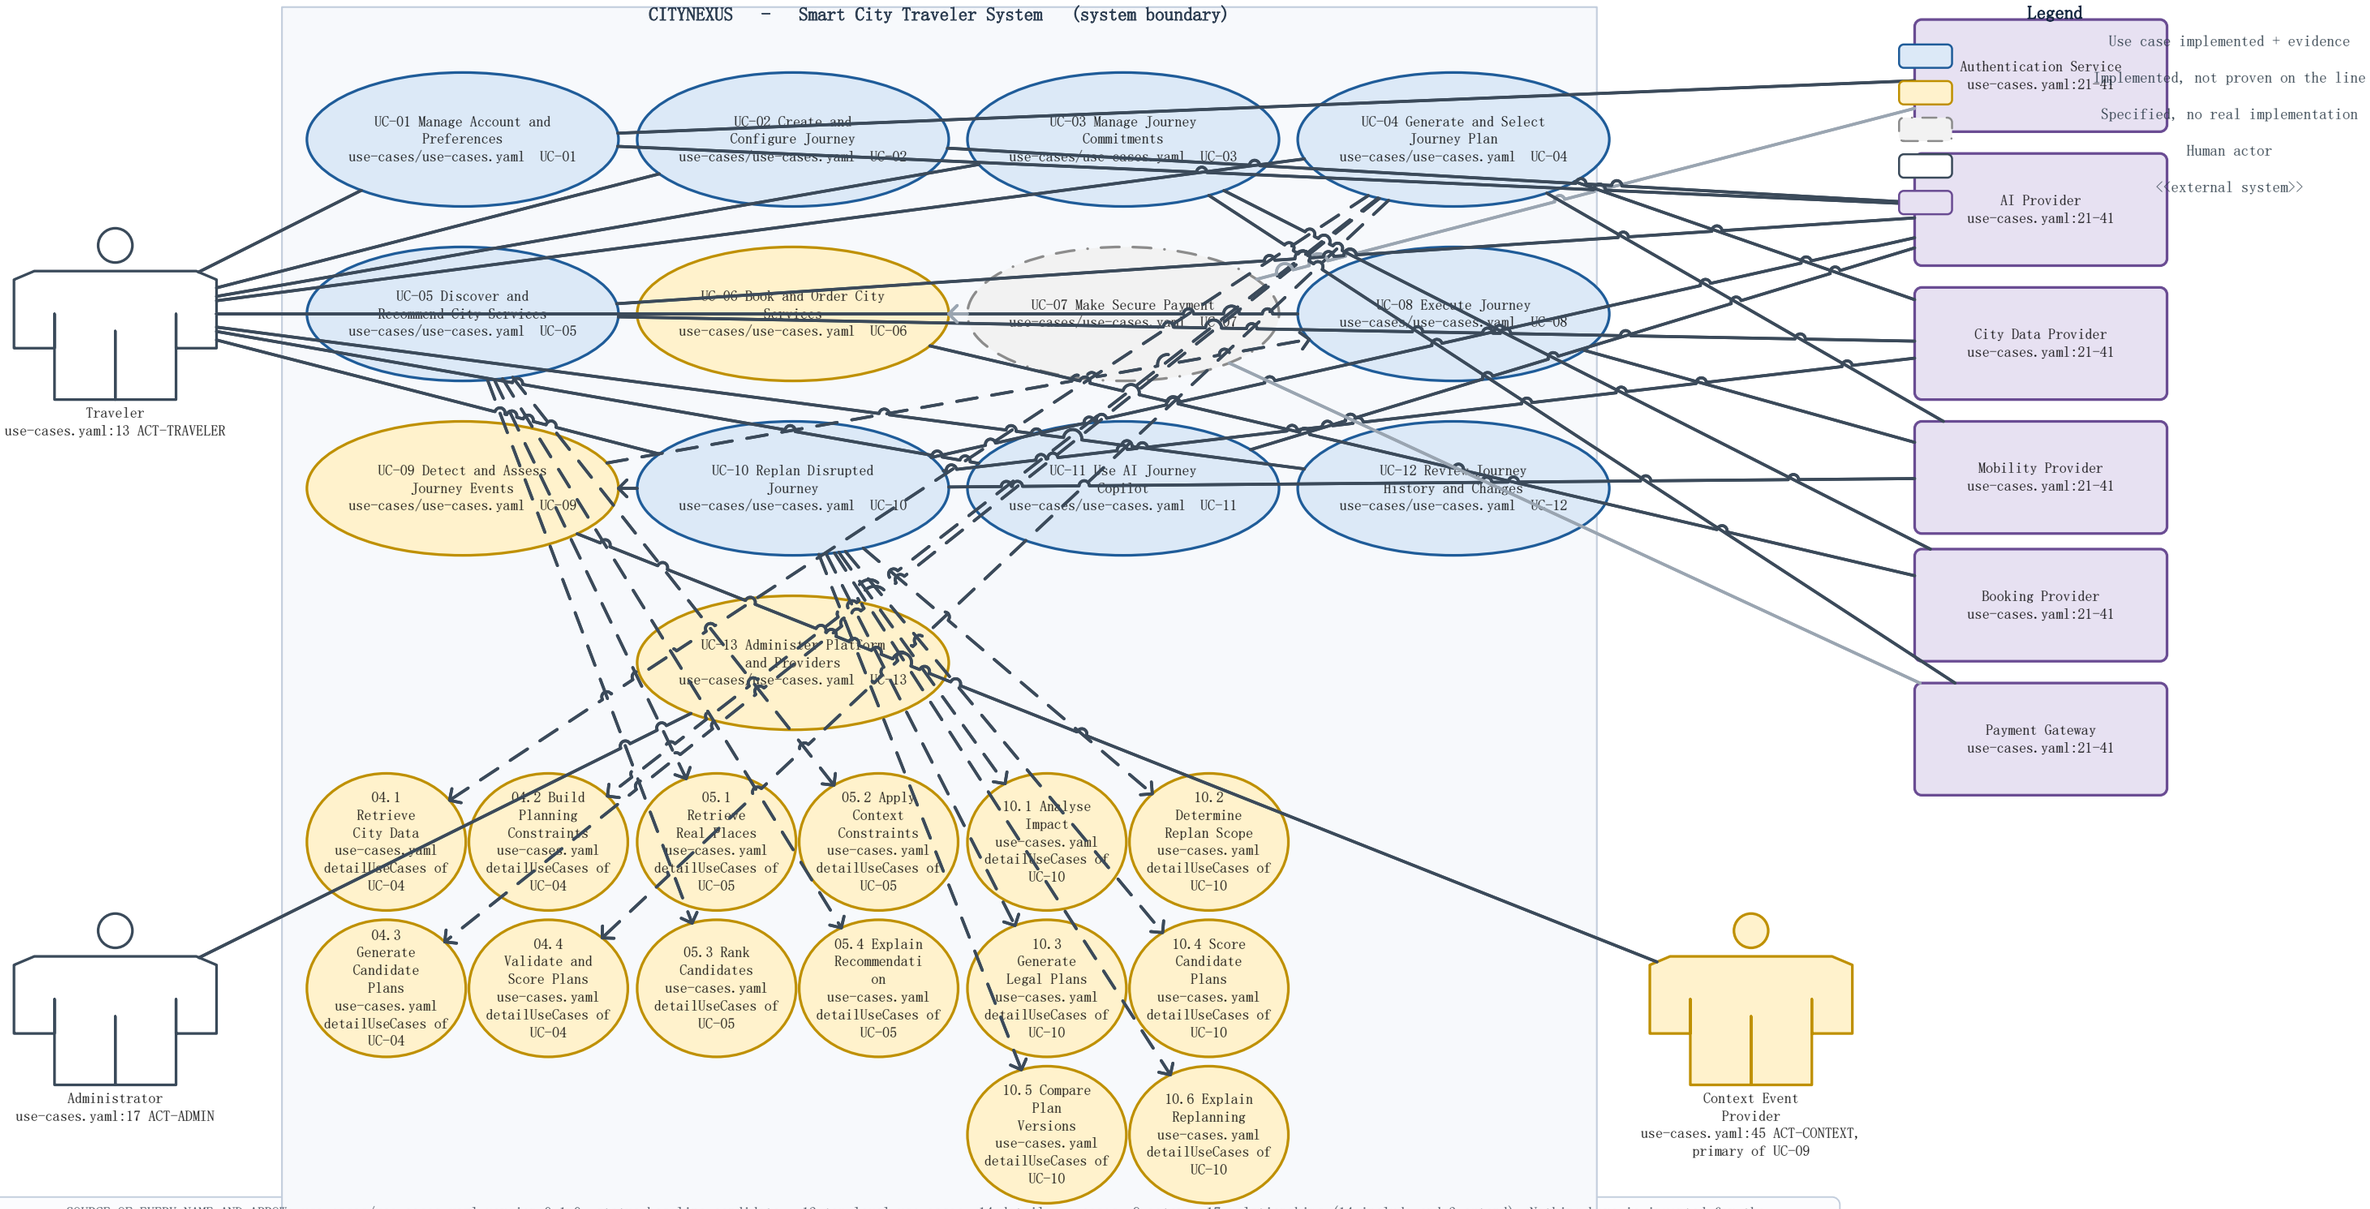
CityNexus | UML Use Case Model

CNX-SE-VIS-04 UML use case diagram
Rev A • generated 2026-10-22 • source tree D:\moodle\CityNexus @ review/boli-party-occupancy-scope-r1

Thirteen top-level business use cases with exactly the actors the specification names: one traveler, one administrator, one event source and six external systems. Included detail is drawn for the three use cases whose decomposition is part of the Part 2 documentation scope; extend arrows point at the base use case, as UML requires.



SOURCE OF EVERY NAME AND ARROW: use-cases/use-cases.yaml version 0.1.0, status baseline-candidate - 13 top-level use cases, 14 detail use cases, 9 actors, 17 relationships (14 include and 3 extend). Nothing here is invented for the picture.

UC-07 Make Secure Payment is drawn dashed on purpose. The requirement baseline contains it, but no real payment instrument is registered: the code ships mock-payment only and AGENT_TOOL_CATALOG.md:16-18 states that payment capture and refund are not registered.

The internal planning solver is deliberately not an actor (use-cases.yaml modelNotes), and the AI provider may suggest, extract or explain but never owns feasibility or persistence authority.

All requirements are still status proposed: the customer agreement the coursework asks for is a separate deliverable, so this model is a baseline candidate rather than an approved scope.
